**Sidenote: UltraSPARC T1 and SPECweb2005**

I looked for a project into the SPEC website today and saw that the T2000 still leads the SPECweb2005 benchmark by roughly 4000 points. And this benchmark was made on the T2000 in November last year. Even the new Woodcrests stopped short of 10000 points and that were already fully blown 4 core systems (maximum for Woodcrest right now). Now keep in consideration that Niagara II already runs in our labs. Interesting times . Well ... Rolf, we should do the power meter gag again next cebit
