Final Patches for telnetd vulnerability

The final patches for the telnetd vulnerability in Solaris 10 (Sunalert 102802) are available at Sunsolve:120068-02 for SPARC120069-02 for X86. My recommendation is to patch the telnet, but leave it deactivated (unless you have some old legacy applications, which need it. The bad administrator habit of using telnet is not a legacy application)
