Mr. Milberg again ...

Mister Milberg develops to an major pain in the a...., well ... a major annoyance: This time he tries to tout Mainframe on Linux. But Jeff Savit comes to help: Once again, "Mainframe Linux vs. Unix". He summarize the problems and shortfalls of Mainframe Linux quite well.

My personal opinion: There is no incentive in using Mainframe Linux besides of rebates on services or extensions for beeing a reference customers for this ill-born mutant. For some time, the virtualisation was a kind of an argument. But even this isn't an argument anymore since the advent of XEN, VMware and Solaris containers.

Last I saw it (3 yrs ago) they could only do 31 (yes that $2^5 - 1$) bits meaning that your process can consume only 2GB memory. That's just laughable.
