Reinventing the wheel ... the millionth time.

Sorry for backbiting: But ... yet another new scheduler for Linux?

But it's certainly an advancement to have interchangeable scheduler classes at run time in Linux. It's a rather old hat in the Solaris world (well, i think it's in Solaris since 1999 or so), but nevertheless it's quite handy feature . And the resource management of Solaris is build upon such a scheduler class.
