Minor fuckup

The webserver had some stability problems in the last few days due to high load. Additionally Frank warned me, that he used the links to the T2 photos in a marketing campain. Thus i had to do something and i´ve migrated it to a different webserver software. c0t0d0s0.org operates now on lighttpd with a fastcgi-php in conjunction with the XCache opcode cacher. The memory consumption is reduced by a huge margin and the load to the database seems to be more steerable. So far i even like the strange way to configure lighttpd...

why is lighty strange to configure? enable mod, configure mod, do it again

IMHO lighttpd is really easy to configure compared to apache(2)

The concept of conditional configuration is a little bit strange at first, although you you do the same at apache, only in a more familar syntax ...
