### **What's new in Solaris 10 8/07?**

You can already find the What's new in Solaris 10 8/07? document on docs.sun.com. Many really cool feature found their way into this release: Big ones like iSCSI Target or the lx brand for BrandZ (aka running 32-bit linux applications in a Solaris 10 container) and smaller ones like the tighter integration of x86 hardware into the fault management architecture.
