### **Jumpstart Tutorial postponed**

I've slowed down the work on my Jumpstart tutorial. PXEgrub isn't able to initialize the network cards at the moment (i even tried an old realtek card) and i haven't the least inkling of an idea, why this is the case.

What do you need to know? We use PXE boot with Custom Jumpstart for all of our Solaris x86 installations, both on Sun and Dell servers.

I think it's just a bug in BIOS of the system. With virtualbox i had no problems to get this up and running.
