Sun Java System Web und Proxy Server opensourced

Two further products gone the opensource path. Sun opensourced the Sun Java System Web und Proxy Server. Especially the webserver is interesting. It's not that known than Apache, but's nevertheless an excellent product.

... and in contrast to Apache it has a servlet engine (like Tomcat) that is included. It also has a better threading model. No MPM configs and the like. In many many cases it is a better alternative. Of course, not in all cases.

with the choice of a bsd license, there's a good chance some of its ideas could be used to improve apache.
