At last - or: NGROUPS revisited

A month ago i wrote about the PSARC case to resolve one issue with the maximum number of groups a user can belong to. Well, the code from resulting from this PSARC found its integration to OpenSolaris today. At last ... the 16 (respectively 32) groups limit is gone. The new limit is 1024. As this is the number of maximum groups per user in Windows and additionally Windows Integration the main reason for users in many groups, this should be sufficient.
