## **Solaris 11 and OpenLDAP**

A nice explanation how to use OpenLDAP as a name service directory and enabling the administration of the content of the directory (in order to make `useradd -S ldap` work) in Solaris 11: "Getting Started with OpenLDAP"

Update: "Adding Users with OpenLDAP" gives some additional information in regard of adding users.

How can I enable ldaps without having to edit `/lib/svc/method/ldap-olslapd`?

Also, `dhcpcd` isn't build with ldap support
